

Scenario D — GUI and Usability Test Report

Status: Windows execution expanded; compatibility expansion pending

Test dates: 2026-07-30 to 2026-07-31

Environment: Windows, in-app Chromium browser, 1280 × 720 SUT: <https://prod-dev.ems-fitus.cloud>

Scope

ID	Screen	Route	State inspected
D1	Create support request	/complaints/new	Validation, attachment boundaries, Cancel, valid submit
D2	My support requests	/complaints, /complaints/33	Pending→Resolved, attachment, official response
D3	Admin request list	/dashboard/admin/complaints	Pending/Resolved, count change, filters, wrong-role access
D4	Admin request detail	/dashboard/admin/complaints /33	Lightbox, internal note, validation, response, Resolved

Task 2 with real participants is intentionally excluded. No participant identity, session, SUS, or UEQ-S data is included.

End-to-end result

The linked user→Admin→user workflow passed. User Test User created request #33, Admin located it while Pending, added the internal note HW03- INTERNAL- NOTE- 23127209, sent an official response, and changed it to Resolved. The user then saw the official response and notification, while the internal note remained hidden.

Property	Verified value
Request	#33 — HW03 Scenario D end-to-end test 23127209
User	nakhoa232@clc.fitus.edu.vn
Type	Support
State transition	Pending → Resolved
Pending count	11 → 12 → 11
Attachment	Valid PNG accepted; detail displays at tachment_1
Official response	Visible to user
Internal note	Visible to Admin only
Notification	User count increased to 1

D1 observations

- Valid PNG preview, removal, submission, and disabled Loading state passed.
- A .txt file was rejected with “Only JPG, PNG, GIF and WEBP images are accepted.”
- A 5,243,904-byte PNG was rejected with “Each image must be 5 MB or smaller.”
- Six images were rejected with “You can upload up to 5 images.”
- Cancel returned to My Requests and discarded the unsaved title/description.
- Signed-out deep linking redirected to /login?callbackUrl=%2Fcomplaints%2Fnew, and login returned to D1.
- Empty submission exposes one aggregate alert; focus remains on Submit instead

of moving to an invalid field.

- The request-type select has no programmatic name.
- Successful creation redirects to the record list without explicit confirmation.
- White text on the cyan primary control measured 2.08:1; gray helper text

measured 2.56:1 and pink error text measured 3.53:1.

- At 320 CSS px, the user header exceeds the content viewport and causes horizontal scrolling.
- Empty validation uses a persistent `role="alert"` message that remains visible beyond 5 seconds without covering Submit.

D2 observations

- Empty state provides a Create request action.
- Request #33 appeared Pending immediately, then Resolved after Admin action.
- Detail shows the official response and hides the internal note.
- Status filter exposes only its current value, not a persistent Status label.
- English UI is paired with a Vietnamese document title.
- Search and status filter state persisted after opening request #33 and returning.
- At 320 CSS px, the document measured 342 px against a 305 px content viewport; the menu control extended off-screen.
- A signed-out detail deep link preserves `/complaints/33` in `callbackUrl`.

D3 observations

- Pending/Resolved tabs and counts tracked request #33 correctly.
- Search, member code, category, date range, Reset, pagination, and Export controls are present.
- Category's native select is unnamed; the custom trigger exposes the unnatural accessible name "All categories Category".
- A normal user opening the Admin-list deep link received a 404 page and no Admin data.
- Search, Pending/Resolved tab, and page-2 pagination state persisted after opening a request and returning; a no-match search displayed a dedicated result message and Reset action.
- Two automated Export Excel attempts produced no captured download. This remains Pending for manual verification rather than being classified as a failure.
- At 320 CSS px, the Admin document measured 516 px against a 305 px content viewport; Export, tabs, and filters were off-screen.
- Vietnamese visible content retained the English document title.

D4 observations

- Status, type, ID, requester, time, content, attachment, note, and response are visible to Admin.

- Attachment lightbox opens, closes with Escape, and restores focus.
- Empty Send produces a page-level alert; focus remains on Send response.
- Response content is required by validation but is not marked required in advance.
- Successful Send changes the request to Resolved and shows explicit success

feedback.

- Empty-response feedback uses a persistent `role="alert"` message that remains visible beyond 5 seconds.

• At 320 CSS px, the Admin document measured 516 px and placed Back, attachment, and form controls off-screen.

• Vietnamese visible content retained the English document title and the English Internal note label.

- A signed-out detail deep link preserved the complete Admin route in `callbackUrl`.

Findings and heuristic score

Eleven findings are recorded: five severity-3 and six severity-2. The provisional usability score is 6/10. The highest-impact issues are form labelling, validation recovery, insufficient contrast, and narrow-viewport reflow. The ux-heuristics framework drove checks for task clarity, navigation orientation, feedback, error prevention/recovery, accessibility, and severity based on frequency, impact, and persistence.

To reach 10/10, the product should first fix accessible labels and validation focus, raise normal-text contrast to at least 4.5:1, and make the user header reflow at 320 CSS px. It should then add explicit creation feedback, preserve meaningful attachment names, and complete verified keyboard-only and failure-recovery paths.

Remaining limits

- Reliable keyboard-only traversal, hover/focus/disabled-state coverage, network-failure recovery, D2 pagination, D3 Export Excel, and upload-progress behaviour remain Pending.
- The 320 CSS px check is a reflow test on Windows Chromium, not evidence of a real phone, mobile browser, or mobile operating system.
- macOS/Linux, additional browsers, tablet, and phone evidence require genuine environments and are not inferred from Windows Chromium.
- Google Form submission has not been performed.
- Unsupported automation was not treated as evidence: request interception, download capture, and synthesized Tab traversal were inconclusive.
